1. **Problem Statement**

At Surabaya Mega Distribusi, our current order fulfillment process is too manual and causes huge delays. Right now, sales dealers submit their orders through WhatsApp or unformatted Excel sheets. Admin staff then manually re-type everything into a master spreadsheet. Because there is no data validation, human errors happen often (for example, typing "PAINT-01" instead of "PNT-01"). Furthermore, the warehouse relies on paper printouts to check physical stock. If an item is out of stock, the sales team only finds out two days later when the warehouse calls them, which leaves orders stuck in a "Pending" status and angers our customers.

2. **Objectives**

For this "Multi-Branch Inventory & Order Fulfillment Optimization (A Business Analysis Case Study)" project, our goal is to design a centralized digital system that fixes these bottlenecks. We want to validate the data at the point of entry, automatically check the warehouse stock, and instantly flag low inventory so orders don't get stuck.

3. **Functional Requirements (FR)**

- **FR-01:** The system must provide a drop-down menu in the Excel form so dealers can only select valid product names.
- **FR-02:** The system shall auto-populate item prices based on the selected SKU.
- **FR-03:** The system must automatically check the inventory database as soon as the dealer uploads the file.
- **FR-04:** The system must instantly trigger an "Out of Stock" alert back to the dealer if the stock is not available.
- **FR-05:** The system must automatically generate a digital picking list for the warehouse if the stock is sufficient.

4. Business Rules (BR)

- **BR-01:** An order cannot be marked 'Fulfilled' if stock is insufficient.
- **BR-02:** All dealers must use the official "BA.xlsx" template to submit their orders; manual WhatsApp orders are no longer accepted.
- **BR-03:** Admin staff are no longer required to manually type order data, eliminating the manual entry bottleneck.
